Using the ZXSC310 to drive high power LEDs from 2 alkaline cell with hysteretic UVLO

Dr. Kit Latham, Senior applications engineer, Diodes Incorporated

Introduction

This note describes how the ZXSC310 boost convertor can be used to drive high power LED’s from batteries of less than 1V to greater than 6V.

The option of under voltage lockout (UVLO) to protect the batteries from deep discharge is also discussed. Two options are described one with hysteresis and a simpler one without.

The device is available in a SOT23-5 package and requires only a few small external components in this application.

Rather than a classical supply philosophy, which would supply the full current to the LED until the battery was exhausted and then switch off suddenly, the ZXSC310 has been designed to allow a graceful fading of the intensity so that the user knows that it is time to replace the battery but can continue to use the torch (flashlight); albeit at gradually reducing intensity. (If a steady current is preferred the ZXSC400 can be used in circuits very similar to those to be described in this note.)

The following paragraphs describe some of the design considerations and trade-offs relevant to such an application.

Heatsinking

The High Power LED’s can be driven at up to 5W and under such drives typically 4W will need to be extracted from the device without the junction temperature exceeding its rated value. If maximum life is required then there should be a margin between the rated temperature and the actual temperature. If the device is expected to be used in an ambient temperature of say 30degC at 4W dissipation then the necessary thermal resistance form the junction to ambient needs to be no more than

\[(T_{jmax} - T_{amb})/P_{diss} \text{ thus:-} \quad (150-30)/4 \text{ K/W = 30K/W.} \]

The LED data sheet for the Luxeon K2 defines the thermal resistance (junction to thermal bonding pad) as 9K/W, leaving a maximum of 21K/W from the mounting point to ambient to be guaranteed by the thermal design of the product. One square cm of FR4 pcb 1.6mm thick has a thermal resistance of about 50K/W from the top layer to the bottom layer, so it is clear that attention needs to be paid to the pcb mounting as well as the thermal path to the outside. Frequently ISM (insulated metal substrate) pcbs are used in all but the most cost constrained applications. If this is not possible then thermal vias can be used to conduct the heat to the bottom of the pcb from where it would need to be conducted to ambient and this is a requirement of the mechanical design of the product.

Sometimes, as in the designs presented below, 5W represents too much battery drain and a lower current is used which eases the thermal design. One K2 LED running at 500mA has a dissipation
of about 1.5W so the maximum thermal resistance then becomes 70K/W - rather easier to implement.

**Choice of inductor**

The inductor is usually the physically largest component in this type of design and there are trade-offs to be made in its selection.

For the best efficiency (read battery life) the inductor needs to be operating within its rating for saturation current and to have an acceptably low series resistance. It should also be physically small and inexpensive. These two pairs of attributes are usually mutually exclusive so a suitable compromise has to be reached and this is a function of the particular application.

Two examples are shown below.

- Driving a K2 at 350mA from 2 alkaline cells.
- Driving a K2 at 500mA from 2 alkaline cells.

The first graph shows how the LED current varies with battery voltage for a 350mA initial current.

![Figure 1 - Basic boost circuit](image1)

![Figure 2 - Performance at a nominal 350mA drive](image2)
This characteristic applies with the following BoM

**Table 1. Bill of materials for figure 1**

</tbody>
</table>

A photograph of this inductor is shown in Figure 3, as can be seen it is low profile and compact.

![Figure 3 - The low profile inductor](image)

**Higher power circuits**

For more LED current an inductor with lower resistance and higher saturation is preferred, the data shown in Figure 4 was obtained using a slightly larger inductor, pictured below the circuit diagram in Figure 5.

![Figure 4 - Performance for a nominal 500mA drive](image)
Figure 5 - The slightly larger inductor

In this case the BoM is:

**Shutdown**

This circuit has no switch off functionality and there is therefore the risk that the cells could go into deep discharge which could lead to leakage. The addition of a few low cost components can get round this problem as shown in the circuit diagram below.

Here the shutdown capability of the ZXSC310 is used to switch the unit off before the cell voltage falls below the specified value. There is then only a very small current drawn from the battery. This circuit will exhibit some temperature dependence as the Vf's of the diodes are temperature dependent, so it may not be suitable for applications requiring constant performance over a wide temperature range.
For this design the BoM is:

The performance of this circuit is shown in Figure 7 for different combinations of diodes and resistors.

![Enable Characteristic with Diode/R cct](image-url)

**Figure 7 - Selection of components for the required UVLO value**
As an example 3 1N4148 diodes and a 62k resistor would give a shutdown at about 1.3V. Resistance values above 75k are too high to give reliable shutdown.

**Switch off with hysteresis**

The circuit above can be improved by the addition of a few more components to give some hysteresis. This avoids the possible scenario where the device switches off reducing the drain on the battery whose voltage then rises and switches the LED’s back on again. The circuit shown in Figure 8 uses 2 transistors in a type of Schmitt circuit to avoid this possibility. The actual switching levels do depend on the transistors chosen. A dual transistor would save a little space but the switching levels may have to be adjusted. The performance of the example circuit is shown in Figure 9.

This circuit will have less temperature dependence than the previous one.

The ZXTD09N50DE6 is a dual in SOT23-6 which gives very similar performance to the 2 ZXTN2040F’s and offers space saving at a slightly higher price.

![Figure 8. UVLO with hysteresis.](image1)

![Figure 9 - Hysteretic UVLO Performance.](image2)
There is a sample schematic which will run with the free downloadable Zetex Simulator available at www.zetex.com and this is a good way of testing the effects of different component values.

**Choice of switching transistor**

The switching transistor Q1 needs high current gain and low Vcesat for the circuit to work properly. The Zetex ZXTN25012 has been developed with this application in mind and whilst other types could be used they would not give the same efficiency and would run hotter.

**Conclusion**

We have shown how, with the addition of a few small components, the ZXSC310 can drive high power LED’s from 2 alkaline cells. Additionally 2 methods of adding UVLO to the designs have been described.

The same principles can be applied to the ZXSC400 which has feedback capability to maintain the LED current more constant as the battery becomes discharged.

Definitions

Product change
Diodes Incorporated has the right to alter, without notice, specifications, design, price or conditions of supply of any product or service. Customers are solely responsible for obtaining the latest relevant information before placing orders.

Applications disclaimer
The circuits in this design/application note are offered as design ideas. It is the responsibility of the user to ensure that the circuit is fit for the user’s application and meets with the user’s requirements. No representation or warranty is given and no liability whatsoever is assumed by Diodes Inc. with respect to the accuracy or use of such information, or infringement of patents or other intellectual property rights arising from such use or otherwise. Diodes Inc. does not assume any legal responsibility or will not be held legally liable (whether in contract, tort (including negligence), breach of statutory duty, restriction or otherwise) for any damages, loss of profit, business, contract, opportunity or consequential loss in the use of these circuit applications, under any circumstances.

Life support
Diodes Zetex products are specifically not authorized for use as critical components in life support devices or systems without the express written approval of the Chief Executive Officer of Diodes Incorporated. As used herein:

A. Life support devices or systems are devices or systems which:
1. are intended to implant into the body
   or
2. support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labelling can be reasonably expected to result in significant injury to the user.
B. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or to affect its safety or effectiveness.

Reproduction
The product specifications contained in this publication are issued to provide outline information only which (unless agreed by the company in writing) may not be used, applied or reproduced for any purpose or form part of any order or contract or be regarded as a representation relating to the products or services concerned.

Terms and Conditions
All products are sold subject to Diodes Inc. terms and conditions of sale, and this disclaimer (save in the event of a conflict between the two when the terms of the contract shall prevail) according to region, supplied at the time of order acknowledgement. For the latest information on technology, delivery terms and conditions and prices, please contact your nearest Diodes’ sales office.

Quality of product
Diodes Zetex Semiconductors Limited is an ISO 9001 and TS16949 certified semiconductor manufacturer.

To ensure quality of service and products we strongly advise the purchase of parts directly from Diodes Inc. or one of our regionally authorized distributors. For a complete listing of authorized distributors please visit: www.diodes.com

Diodes Zetex does not warrant or accept any liability whatsoever in respect of any parts purchased through unauthorized sales channels.

ESD (Electrostatic discharge)
Semiconductor devices are susceptible to damage by ESD. Suitable precautions should be taken when handling and transporting devices. The possible damage to devices depends on the circumstances of the handling and transporting, and the nature of the device. The extent of damage can vary from immediate functional or parametric malfunction to degradation of function or performance in use over time. Devices suspected of being affected should be replaced.

Green compliance
Diodes Zetex Semiconductors is committed to environmental excellence in all aspects of its operations which includes meeting or exceeding regulatory requirements with respect to the use of hazardous substances. Numerous successful programs have been implemented to reduce the use of hazardous substances and/or emissions.

All Diodes Zetex components are compliant with the RoHS directive, and through this it is supporting its customers in their compliance with WEEE and ELV directives.

Product status key:
- *Preview* Future device intended for production at some point. Samples may be available
- *Active* Product status recommended for new designs
- *Last time buy (LTB)* Device will be discontinued and last time buy period and delivery is in effect
- *Not recommended for new designs* Device is still in production to support existing designs and production
- *Obsolete* Production has been discontinued

Datasheet status key:
- *Draft version* This term denotes a very early datasheet version and contains highly provisional information, which may change in any manner without notice.
- *Provisional version* This term denotes a pre-release datasheet. It provides a clear indication of anticipated performance. However, changes to the test conditions and specifications may occur, at any time and without notice.
- *Issue* This term denotes an issued datasheet containing finalized specifications. However, changes to specifications may occur, at any time and without notice.
