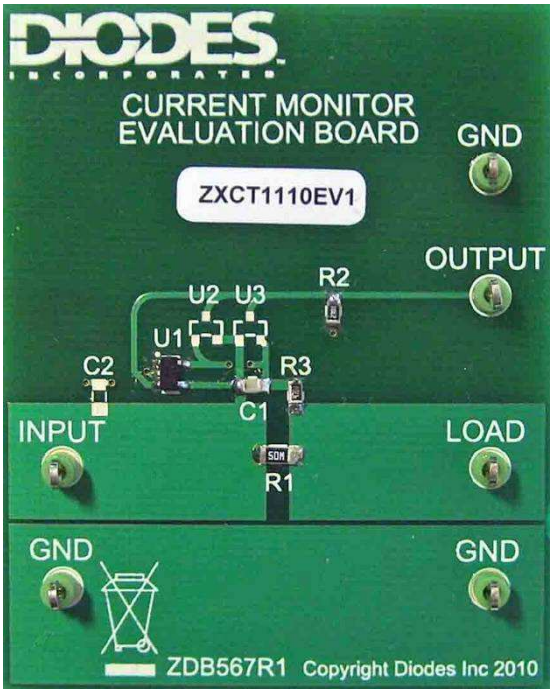
ZXCT1110EV1 USER GUIDE

Performance

- **Current Monitor with wide supply range: 2.5V to 36V**
- **Demonstrates high-side current monitoring up to 4A**
- **Resistors on PCB set sense voltage and voltage gain**
- **Ambient temperature range -40℃ to +125℃**

Ordering Information

Order Number
ZXCT1110EV1



Introduction

The ZXCT1110EV1 evaluation circuit can simply be used to demonstrate the ZXCT1110 Current Monitor integrated circuit which is suitable for a wide range of power systems including automotive, industrial and white goods applications as well as portable and battery management systems.

The PCB is designed to accept one of three different current monitor products, the ZXCT1110 (U1), ZXCT1109 (U2) or ZXCT1107 (U3).

In this case the ZXCT1110 is fitted, but if desired, using conventional lab soldering and de-soldering techniques, this device can be removed and an alternative device fitted.

The ZXCT1110 provides an output voltage proportional to the current in an external load from two external resistors, a sense resistor and a gain set resistor, both are included on this PCB. This enables rapid evaluation of the ZXCT1110 for end user product design.

The construction is a double-sided FR4 printed circuit board, 63.5 x 50.8 x 1.6 mm with 2oz/sq ft copper (70µm).

1	TP7	Loop Terminal, 2.15mm, green	Ground	Hughes	100-108

Table 3 – ZXCT1110EV1 I/O and Test Points

Detailed Description

As can be seen from the test setup in Figure 3, the ZXCT1110EV1 is designed to connect a power supply between test points TP1 and TP3, a load and DMM between test points TP4 and TP5, and a DMM to measure the output voltage between test points TP6 and TP7.

The sense resistor is R1=50mΩ (+/-1%) such that a load current of 2A produces a nominal sense voltage input to the ZXCT1110 of 100mV. From the datasheet, a sense input of 100mV produces a nominal output current of 400uA (**+/- 1.8%** at 25^{o}C).

The preferred value of R2=2.7kΩ (+/-1%) will therefore provide a nominal output voltage between TP6 and TP7 of **1.08V**, giving a total voltage output error of **+/-3.8%** for the ZXCT1110EV1 circuit for a 2A load.

As also described in the datasheet, resistor R3 provides S- input protection and together with C1 provides attenuation of possible load generated EMC that might affect the IC input bias conditions.

Quick Start Guide

Suitable test equipment is given in the Table 4.

1. Set the power supply to 10.0V but do not switch on. Set the current limit to 5.0A.
2. Connect up the ZXCT1110EV1 board to the equipment as in **Figure 3** below. Set DMM1 to measure DC voltage. Set DMM2 to measure DC current.
3. Connect the 5Ω load resistor or set the electronic load to draw a current of 2A.
4. Switch on the power supply and adjust the input voltage or the electronic load until DMM2 reads to 2.00A.
5. DMM1 reads the output voltage and should read between **1.039V** and **1.121V** given the total circuit errors of **+/-3.8%** for 100mV sense input voltage.
6. Using an electronic load from zero to 4A load the measurements can be repeated to evaluate the circuit output voltage linearity & errors across the specified input voltage range.

   Figures 4 to 6 demonstrate the product capability and possible V_{S+} errors (refer to datasheet).
7. Switch off the supply and remove the test connections. This concludes the demonstration.

LIFE SUPPORT

Diodes Incorporated products are specifically not authorized for use as critical components in life support devices or systems without the express written approval of the Chief Executive Officer of Diodes Incorporated. As used herein:

A. Life support devices or systems are devices or systems which:

1. are intended to implant into the body, or

2. support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in significant injury to the user.

B. A critical component is any component in a life support device or system whose failure to perform can be reasonably be expected to cause the failure of the life support device or to affect its safety or effectiveness.

Customers represent that they have all necessary expertise in the safety and regulatory ramifications of their life support devices or systems, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of Diodes Incorporated products in such safety-critical, life support devices or systems, notwithstanding any devices- or systems-related information or support that may be provided by Diodes Incorporated. Further, Customers must fully indemnify Diodes Incorporated and its representatives against any damages arising out of the use of Diodes Incorporated products in such safety-critical, life support devices or systems.
